Comment by Rudy Myer:

Proposed classes of works: 3 and 5

I am supporting both the jailbreaking of Consoles and Mobile Phones/Tablets alike.
When someone purchases a console or mobile phone/tablet, They should have the right to do whatever they please with it thereafter. Not only users who want root access to the device They Paid For. But the developers who want to learn more about the devices, and code their own programs and tools to make the device's more useful for the end user.

One device i've used for a long time is the Apple IPod, And i've almost always had it jailbroken, While its jailbroken I can customize is in ways that apple would not let you change before. As well as enhanced security features; That allow your ipod to be tracked better than the built-in FindMyIpod. And useful tools that utlize the battery more easily, controlling features at the swipe of a screen, Even making the music player look like a microsoft zune media player. All these tools were made by someone not working for apple, and are provided free by developers who spent alot of time on their work to help everyone have a better experience with their device. And there shouldn't be anything wrong with that, This should even be an appeal for apple to have More people purchase their products.

Now phones are somewhat different, but the same points apply. User-Created content to improve the experience, And User-Created applications to expand on what the manufacturer might or might not provide.
