

Hello My name is Steven Camp

And here is what I use Root for on my Android phone.

1. I use Rooting to Install a Recovery system on my phone. This enables me to be able to back up my entire phone should it be lost or stolen. This also allows me to keep a backup copy in case of crash.
2. I am able to use an app that is called Root Explorer. This is a very useful app that allows complete navigation of the operating system.
3. I use SetCPU. This app allows the Overclocking of my device. In other words bring the devices hardware to its maximum potential. It also allows you to underclock. Doing this helps save battery life which is very important with todays devices.
4. I also use Titanium Backup. This app backs other apps up thus allowing to save data at various states in the app.

All of these things are useful and allow me the end user to use the phone as I wish instead of being locked down to only one way of doing things.

Can you imagine if you bought a house and someone said Sorry you can only sleep in the Bedrooms. You cant sleep on the couch in the livingroom. That's illegal.

Or you cant add on any extra rooms. You are stuck with the house in the state it is in.

Please make rooting and Jailbreaking legal for all time.

Thank you.

Steve Camp
